## SUPPLIER QUALIFICATION

... gains more and more importance due to competitive international markets and constantly growing quality requirements. Suppliers seek for an optimized product quality. Procurement managers respectively users/customers of these products demand first-class quality, resulting from error-free processes in production.

In the focus of supplier qualification you will find:

- Analysis of potentials
- Non-conformity-process-cycles
- Compliance with control loops in order to assure quality requirements
- Documentation, customer care and customer satisfaction
- Service
- Supplier-management

We offer:

- Qualification and auditing of established suppliers (continuous checks of existing processes, instructions, certifications)
- Auditing of new suppliers (check and qualification of the company's processes, e. g. according to ISO 9001 or VDA 6.3)
- Implementation of new methods and control loops
- Measure-validation in the supplier's company
- Process audits according to VDA 6.3

We

- are well acquainted to all necessary tools
- have a proven track record in different fields and have achieved sustainable results
- are capable of introducing and installing the best process possible for your needs

## PRODUCT QUALIFICATION

Within product qualification, focus is on the product itself or on any component. During operations, products/elements/components are subject to various influences that have an impact on function, life cycle, quality and reliability of the product.

We trace compliance with specifications and are able to, amend and implement such respective specifications. Our product qualification tools assure that all your products meet outlined requirements and fulfil their function reliably and consistently.

Product qualification is built on:

- Compliance with standards and instructions
- Compliance with specifications
- Identification and sustainable elimination of non-conformities
- Validation of products, measures and methods
- Continuous monitoring of products and processes

In case of non-conformities (production or delivery of defective, finished products), Schumann Solutions develops control loops in order to sustainably eliminate such identified non-conformities.

- Validation and verification of processes
- Integration of those (improved) processes into the supplier's organisational structure
- Final documentation being a valuable proof of quality for the end-customer
